

# The INVESTMENT NETWORK

A decentralized exchange for private companies to list their Units(like - shares/stocks) for the Investors to buy , sell or hold these units.

## Problems and fixes :

1- There are numerous exchanges around the globe for investors to conduct their transactions. When buying shares of a company, individuals need to first convert their currency to the nation's currency where the company is located and then execute the transaction on that particular company's exchange.

2- Flexibility in trade timing for the transactions to be cleared.

## The Innovation :

1- A Single platform having a bunch of companies listed around the globe and the investors will be potentially buying units of that company (These units are **NOT** stock or shares of that company).

Unit - A unit will be another digital asset of the company , that will help to raise the capital .
